

## Autogard Torque Limiters

**Product:** Series 200 Torque Limiter

### **Function:**

The final stage in the printing of books involves folding the printed sheets into “signatures” which are then sent to the binding machine. The folder of this high-speed printing press, running at up to 350 meters per minute, can be severely damaged if an excessive number of sheets are forced through the folding die. Without protection, the drive shafts can easily be twisted or sheared, causing production delays.

### **Drive Specification:**

Direct drive from an AC electric motor via a gearbox.

### **Torque Limiters:**

Special synchronized model 204 AF 4 (now superseded by 404 SR 4).

### **Benefits:**

There is now no danger to the folder, even if a large number of sheets are forced through. Down time has been greatly reduced, as the torque limiter enables rapid resetting after a jam. The folder remains synchronized with the press.

The reliability of the folder is used as a selling point for the whole machine.
